"Study of the Extraction Rates in Systems Containing Tributyl Phosphate. IV.  
Extraction of  $\text{UO}_2(\text{NO}_3)_2$  While Mixing it in a Centrifugal Field"

Leningrad, Radiokhimiya, Vol 14, No 2, 1972, pp 235-241

**Abstract:** A study was carried out on the extraction rate of uranium in the system  $\text{UO}_2(\text{NO}_3)_2\text{-HNO}_3\text{-H}_2\text{O}$ -tributyl phosphate-solvent in a centrifugal field. It has been shown that under these conditions the kinetics of mass transfer depends to a great extent on the rotation rate. With a 4000 rpm rate the extraction process is practically completed in 0.8 sec. The effectiveness of the extraction is about 1.3 times greater when carbon tetrachloride is used as a solvent instead of the usual mixture of saturated hydrocarbons boiling in the range 110-270°C. Hydrodynamic properties of the centrifugal extraction apparatus have been studied; formulas were developed for the calculations in layer separation chamber. It has been established that the completeness of phase separation is determined by the velocity of phase flows, rotation rate of the apparatus, and the difference in phase densities.

"Structure and Magnetic Properties of Mutual Solid Solutions of Iron and  
Nickel Monoaluminides"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 33, No 3, Mar 72, pp  
602-606

**Abstract:** The lattice period, density, and temperature dependence of susceptibility of solid solutions of  $Fe_{1-x}Ni_xAl$  ( $0 < x \leq 1$ ) are measured, and their energy spectrum is discussed. The curve for the lattice period as a function of composition shows anomalous behavior: the lattice period decreases linearly with increasing  $x$  from approximately 291 pm for iron monoaluminide to 288.7 pm for 50 mol.% NiAl, remaining constant above  $x = 0.5$ . The temperature-dependent part of susceptibility in the intermetallic compounds is attributed to iron atoms. The concentration dependence of the properties of mutual solid solutions of iron and nickel monoaluminides is explained in terms of redistribution of electron densities.

"Magnetic Susceptibility of the  $\beta$ -Phase of the Ni-Al System"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 30, No 4, Oct 70, pp 740-745

**Abstract:** Measurements were made of  $\beta$ -phase specimens of the Ni-Al system to determine the magnetic susceptibility at 20-600° K and the electrical resistance at room temperature. X-ray-metallographic investigations and density measurements substantiated the results. A specific point on the composition-property diagrams is attained at 50 at. % Al. The magnetic susceptibility of  $\beta$ -phase specimens is related to the Pauli type. The density estimate of electronic states for the NiAl equiatomic alloy is ~0.49 1/eV·molecul.

"Gamma-Relay Level Gage for Automatic Dosage Control"

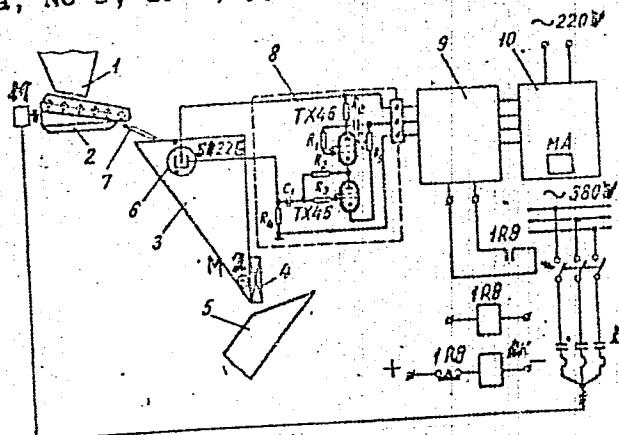

Moscow, Mekhanizatsiya i Avtomatizatsiya Proizvodstva, No 5, 1970,  
pp 38-39

Translation: Volume dosage was applied to a rebuilt furnace of a metallurgical plant since, under the prevalent technical conditions, it was impossible to use a complex of typical equipment and mechanisms for assembling and dosing the coke in mass. Based on a GR-7 radioisotope gamma relay, a system for automatic regulation of coke volume dosage controlling a roller disc screen for sifting coke particles and a main skip hoist (see drawing) was developed.

Proizvodstva, No 5, 1970, pp 38-39

Automatic Radioisotope Control System for Coke Dosage  
and Disc Screen Regulation:

2/5

USSR

SMOLYAK, V. A., et al., Moscow, Mekhanizatsiya i Avtomatizatsiya Proizvodstva, No 5, 1970, pp 38-39

- 1) coke bunker;
- 2) disc screen;
- 3) coke hopper;
- 4) gate;
- 5) skip;
- 6) radiation detector;
- 7) nozzle for adjusting input coke mass;
- 8) sensor;
- 9) electronic relay block;
- 10) control block

The radiation source is in a cast iron collimator container outside the weight hopper 3. at its side wall. The container provides safety from radiation and forms a gamma radiation beam directed toward the detector 6, which uses a SI22G counter in a protective tube 200 mm in diameter and with a wall thickness of two mm in the upper part of the interior of the hopper 3. The placement of the detector inside the object measured, where the radiation by 30-40% the activity of the source and thus reduces the danger of radiation to personnel operating the loading mechanism.

To prevent false operation of the gamma relay and to improve the coke dosage automatic control system, a radiometric pair

3/5

USSR

SMOLYAK, V. A., et al, Moscow, Mekhanizatsiya i Avtomatizatsiya Proizvodstva, No 5, 1970, pp 38-39

(source and detector) was placed so that the gamma beam, perpendicular to the longitudinal axis of the screen, is not interrupted by the flow until the moment the hopper is filled with a specified amount of coke and its top is hit by the gamma beam.

To adjust the system -- i.e., to change the specified mass within the limits of 100-200 kg -- the pouring nozzle 7 is shifted by 200-300 mm and pulls the top away from the gamma beam to the screen opposite the wall of the hopper, so that the latter is filled with a large quantity of the coke before the screen is switched off. And, conversely, the sideward approach of the top to the vertical plane passing through the gamma beam leads to an earlier intersection of the latter by the top of the coke mass. Consequently, the control of the coke mass within the technical range depends on which of the following interrupts the gamma beam: the top of the poured coke mass or the side slope ascending to the top. In the latter case, the top is higher than the level at which the gamma beam is permitted to pass.

4/5

USSR

SMOLYAK, V. A., Et al., Moscow, Mekhanizatsiya i Avtomatizatsiya Proizvodstva, No 5, 1970, pp 38-39

This control system also contains a sensor, an electronic relay block, and a control block, as well as a low-current control for the electric-feed network of the disc screen.

The control signal from the sensor is applied to the relay of the electron relay block operating in the positive (triggered) position. When the hopper is filled with the specified amount of coke, the gamma beam intensity is weakened to one-third its former level, and contacts IRB of the switch are opened. The coil of IRB is deenergized, the closed contacts IRB in the coil of the linear contactor LK open, and the motor M of the disc screen is switched off. The screen is once more switched on after the gate 4 is opened (motor N2) and the coke is poured from the hopper into the skip 5.

The radioisotope automatic coke dosage regulation systems are based on both coke-loading mechanisms. The annual saving to the economy amounts to 42 thousand rubles.

"Detection of Virus-Related Formations in Larvae of Aedes and Culex Mosquitoes"  
Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 41, No 4,  
Jul-Aug 72, pp 490-492

**Abstract:** Larvae of Aedes aegypti L. and Culex pipiens molestus Forsk. mosquitoes bred in the laboratory developed an infectious disease in the 4th instar and the stage of pupa formation that could be ascribed to a virus. The disease caused death of up to 30% of the larvae. In the cytoplasm of the fatty bodies of infected larvae inclusions were found that were similar to those that are caused by Vagoiavirus and are present in larvae of some Culex species from natural bodies of water. In addition to formations due to Vagoiavirus, the infected larvae of the laboratory cultures and those of Culex mosquitoes from natural bodies of water also had cell nuclei that exhibited hypertrophy and were structurally analogous to those found in densonucleosis of Galleria mellonella. Evidently the larvae were infected with a combination of two entomopathogenic viruses.

"Effect of Alloying on the Hardness of Ni<sub>3</sub>Al Alloys"

Metallofizika. Resp. mezhved. sb. (The Physics of Metals. Republic Inter-departmental Collection of Works), 1971, vyp. 33, pp 120-122 (from RZh-Metallurgiya, No 1, Jan 72, Abstract No 11781 by author)

Translation of Abstract: A study was made of the effect of Cr, Ti, W on the hardness of Ni<sub>3</sub>Al alloys. Alloying in all cases resulted in an increase of hardness. The maximum increase in hardness was observed in two-phase Ni<sub>3</sub>Al alloys containing beta phase based on another metallic compound -- NiAl. For pure Ni<sub>3</sub>Al and its chromium-doped alloys a study was made of the temperature-dependence of hardness during heating in the 20-900° range. When single-phase alloys containing Ni<sub>2</sub>Al-base γ' phase were heated, alloying resulted in strengthening of the alloy at elevated temperatures. When two-phase alloys (γ'+β) were heated, a complex character of the variation of alloy hardness with temperature was observed. It should, however, be noted that at high temperatures (800-900°) this hardness of single-phase alloys is higher than that of two-phase alloys, whereas at room temperature the opposite picture was observed. One illustration. One table. Bibliography with four titles.

"Interaction of Incompletely Expanded Stream with Oppositely Directed Supersonic Reference Stream"

Leningrad, Uchenyye Zapiski Leningradskogo Gosudarstvennogo Universiteta, No 357, SER. MAT. NAUK., No 46, 1970, pp 81-91

Abstract: This work presents the results of an experimental and approximation theoretical study of the interaction of two oppositely directed supersonic streams, one of which is incompletely expanded, while the other is a reference stream. The experimental results present the distances from the nozzle of the incompletely expanded stream to the various compression jumps as it meets the reference stream as functions of the degree of difference of the characteristics of the two streams and the mach numbers of the streams. The incompletely expanded stream, moving against the supersonic stream, retains its typical barrel shape and characteristic form of shock waves. However, the central compression jump moves upstream toward the cross-section of the conical nozzle

1/2

USSR

ZELENKOV, O. S., Uchenyye Zapiski Leningradskogo Gosudarstvennogo Universiteta, No 357, SER. MATE. NAUK., No 46, 1970, pp 81-91

by a distance dependent on the parameters of the reference stream. The portion of the stream located between the cross-section of the nozzle and the central compression jump is independent of the opposite flow and remains the same as in a free, individual under-expanded stream. A central compression jump is also formed on the side of the reference stream. Between these compression jumps there is a contact surface, separating the mass of gas of one stream from the other. Parameters of the streams and masses are calculated.

INNERVATION OF THE INTERNAL ORGANSG. V. Stavichek, V. M. Nikulin, R. I. Zelenkov

Yaroslav Medical Institute

Visceral branches of sympathetic nodes leading to the internal organs were investigated to determine the presence in them of intervertebral sensory ganglia neuron dendrites. Afferent spinal conductors have always been demonstrable in the nerves of the esophagus, lungs, heart, small intestine, liver and kidneys of men and dogs, but there is a great difference in the number of these fibers in the nerves of various organs. Thus, the absolute number of sensory conductors is the highest in the esophageal nerves and diminishes in the following order: esophagus → lungs → heart → liver → small intestine → kidneys. Viscerosensory functions of certain organs, especially of the small intestine, kidneys and liver are provided with a relatively small number of neuron elements coming from intervertebral nodes. It is obvious that many internal organs possess local neuro-reflexory mechanisms and have no need in a greater scope of afferent spinal cord innervation for the implementation of specific functions.

"Proton Beam With an Impulse of Up to 70 Gev/s Elastically Dispersed Inside a Target"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol 42, No 7, 1972, pp 1437-1445

**Abstract:** This paper discusses the operation of a channel built into the French liquid-hydrogen Mirabelle chamber for the accelerator of the Institute of High-Energy Physics (IFVE). The function of the channel is to form pure beams of pi and k mesons, and antiprotons, in a broad range of impulse magnitudes under the action of a high-frequency separator. The secondary particles are generated on the inside of a target placed in the path of a proton beam diverted from the accelerator with an energy of 70 Gev. By using a fast system for aiming the proton beam at the target, together with a kicker magnet in the channel, the required number of particles passing through the chamber can be provided. The optical system of the channel is described with the

Welding

VACUUM-DIFFUSION WELDING UNIT

UDC 621.791.533.373.3.037

Article by Candidate of Engineering Sciences G. V. Kondratenko and Candidate A. A. Mezakov and S. P. Zhdanov, Scientific Polytechnic Institute, Institute of Radioelectronics, Moscow, No. 12, 1972, pp. 55-56.

Production of units UDS-2 and A.306.20 has been mastered. Metals and alloys (steel-steel, copper-copper, steel-aluminum, steel-aluminum, aluminum-aluminum, stainless-titanium, etc.) as well as nonmetals (copper-ceramic, Kovar-titanium, etc.) as well as compositions which are identical to their initial state for all the basic characteristics (strength, ductility, thermal stability and electrical conductivity). Owing to this it is possible to weld parts without restriction or thicknesses ranging from 0.1 to 1.0 mm. These units make it possible to combine the process of welding, vacuuming of electric-vacuum instruments, sintering and assembly of switching fixtures of unit A.306.20 in one furnace.

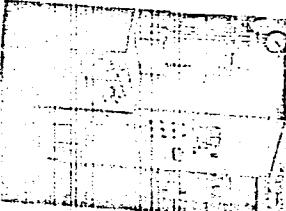

A.306.20. Unit UDS-2 (see Fig. 1) is easier to operate than the original control elements and panel. Productivity of the unit was increased by means of improving the system of shielding and sealing the bottom of the housing and welding carbon support.

The control apparatus and panel of the unit makes it

possible to perform smooth adjustment and regulation (control of welding temperature is automatic) of the welding mode parameters according to specified conditions.

"Electron Microscope Method of Quantitative Determination of the Viscous Component in a Fracture"

Moscow, Zavodskaya Laboratoriya, No 12, 1972, pp 1477-1479.

Abstract: It is suggested that the percentage of the viscous component in a fracture be determined by statistical processing of the data from electron microscope studies. The confidence interval of the deviation from the arithmetic mean value of the percentage of the viscous component for three specimens with a reliability of 0.95 was found to be  $\pm 5.2\%$ .

ZELENOVA, V. D.

"All-Union Scientific and Technical Conference on 'Advanced Methods of Heat Treating Metals and Alloys'"

Moscow, Metallovedeniye i termicheskaya obrabotka metallov, Sept 71, no 9,  
pp 76-78

**Abstract:** The article discusses the All-Union Scientific Research Conference on Advanced Methods of Heat Treating Metals and Alloys, held in June 1971 in Rostov-na-Donu. It was attended by about 270 participants representing 58 industrial enterprises and scientific-research and educational institutions of the USSR. Some 35 reports were delivered dealing with the theory and practices of physical metallurgy and heat treating of steels, advanced experimentation and structural strength problems of machine parts subjected to heavy stresses. In his opening address, Yu. M. Lakhtin (Chairman of Physical Metallurgy and Heat Treating Section, NTO Mashprom) spoke of current problems and of the final results of the 1970 conference held in Voronezh. The first report by N. N. Kidin, V. I. Lizunov, and V. M. Belyanskaya dealt with high-speed electric heating combined with austenite

no 9, pp 76-78

deformation to produce natural-fiber construction materials. I. N. Bogachev  
discussed a new approach to problems of increasing the contact strength of  
metallic materials where failure may occur due to fatigue, corrosion, or  
brittleness. A paper on increasing the structural strength of heavily  
stressed machine parts was read by V. D. Kal'ner, V. P. Nikonov, and S. A.  
Yurasov. The central topics of this report concerned combined techniques  
of the thermal hardening of parts including grain-size control, nitriding,  
etc. K. Z. Shepelyavskiy et al. reported on a new method of surface harden-  
ing with deep heating and the use of steels of standardized hardenability  
for bearings for tractor applications. The topics discussed in the sub-  
sequent reports stressed practical utilization of thermomechanical treatment  
to increase the strength of constructional steels, theoretical and applied  
problems of chemical heat treatment of metals in melts, protective nitride  
coatings on refractory metals, heat-resistant coatings for nickel-base alloys,  
improvements in the machinability of lead-containing steels, optimal heat-

treating conditions for various machine parts, including heavy shafts and turbine rotors, new data on brittleness thresholds, and fracture types, critical deformation rates, optimum compositions of rail steels, structural changes with martensitic transformations due to plastic deformation, and programmed loading and tempering under stress. To summarize the views of the participants, the conference adopted a resolution on the importance of experimental and theoretical research in physical metallurgy and heat treatment of materials as a means of meeting the paramount tasks of the Ninth Five-Year plan set forth by the 24th Congress of the Party on increasing the service life and reliability of critical machine parts.

The formation of uranium and selenium ores takes place at the reducing barriers of hydrogen sulfide and gley deposits of stratum oxidation. The deposition of uranium, selenium, iron sulfides and sulfides of chalcophytic elements is a characteristic feature for hydrogen sulfides reducing barrier. At the gley barrier uranium and selenium are deposited, but sulfides of iron and chalcophytic elements are not concentrated there. (auth)

"The Tendency Toward Brittle Failure of Titanium-Containing Steels"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 11, 1972,  
pp 60-61

**Abstract:** A study was made of the tendency toward brittle failure of 30KhT2 and 30KhT2N3Yu steels containing 2.1% Ti, in order to determine regions of their applicability. Specimens with and without nitrated layer, the latter with notches, were subjected to impact tests. Their impact strength and cold brittleness threshold were determined and the macro- and micro-structures of fractures after tests at different temperatures were analyzed. According to test results and electron-microscopy investigations, the lower cold brittleness thresholds of 30KhT2 and 30KhT2N3Yu steels are at 10°C and 40°C, respectively. Because of the high temperature of the lower threshold of cold brittleness, the 30KhT2 and 30KhT2N3Yu steels are not recommended for parts working under conditions of significant impact loads. Two figures, one table, three bibliographic references.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. STEELS 12G2AF, 15GYUT, 10G2B, AND 30T WERE STUDIED UNDER 2 STRUCTURAL CONDITIONS: (1) FOLLOWING NORMALIZING AT 910DEGREES, GRAIN SIZE MARK 10-11; (2) IN THE HOT ROLLED STATE, TEMP. OF FINAL ROLLING 880-910DEGREES, GRAIN SIZE MARK 8, SIGMA EQUALS 53-6 KG-MM PRIME2. OVERALL IMPACT FUNCTIONS, TAKEN FROM THE COMPONENTS ONSET AND CRACK PROPAGATION FUNCTIONS, WERE INDEXED FOR ALL OF THE STEELS. A METHOD OF INDEXING BASED ON DETG. THE VALUE OF IMPACT STRENGTH AT TEMP. BELOW THE THRESHOLD OF COLD BRITTLENESS WAS APPLIED. THE HIGHEST ONSET AND CRACK PROPAGATION FUNCTIONS WERE OBSO. IN STEELS 12G2AF AND 15GYUT. ELECTRON MICROSCOPIC ANAL. DETD, NOT ONLY THE COLD BRITTLENESS THRESHOLD BUT ALSO THE PECULIAR FINE STRUCTURE OF THE FRACTURE. A MICROFRACTOGRAPH OF THE VISCOUS FRACTURE OF STEEL 12G2AF IN THE HOT ROLLED AND IN THE NORMALIZED STATES IS SHOWN. IN THE AREA OF DUCTILE FRACTURE, A DIFFERENT DISPERSION OF THE CUP-SHAPED STRUCTURE WITH DEPENDENCE ON HEAT TREATMENT WAS OBSO. STEELS IN THE NORMALIZED STATE DISPLAYED MORE DISPERSION OF THE CUP-SHAPE STRUCTURE THAN IN THE HOT ROLLED AND ANNEALED STATE.

CHANGE IN GONADOTROPIC FUNCTION OF HYPOPHYSIS IN YOUNG  
AND OLD RAT MALES UNDER CONDITIONS OF ADMINISTRATING DIFFERENT  
DOSES OF ANTITESTICULAR CYTOTOXIC SERUM

Yu. O. Spasokukots'kiy I. M. Zelen'skyy, O. V. Nishchimenko  
Department of Experimental Therapy, the A. A. Bogomolets Institute of Physiology,  
Academy of Sciences, Ukrainian SSR, Kiev.

Summary

In 142 young and 122 old rat males gonadotropic function of hypophysis was studied in norm and with administration of different doses of antitesticular cytotoxic serum (ATCS). The animals of the same age without serum injection were taken as control. The results obtained testify to the fact that the content of gonadotropins in hypophyses of old rat males with age hypofunction of testicles is higher than that in young animals, that coincides with literary data. When administrating the young males

1/2

REEL/FRAME

19820874

2

AP0052305

high (inhibitory) doses of ATCS, an increase is observed in the gonadotropins content in hypophysis of rats. When administrating the old males with age hypofunction of testicles small (reactivating) doses of ATCS, the initial rise in the gonadotropin content is found with a subsequent considerable drop. Thus ATCS small doses, affecting the specialized cellular elements of testicles, can cause normalization of hormonal status of an organism by "feedbacks" and support homeostasis.

"Evaluation of Types of Winter Wheat With Respect to Resistance to Powdery  
Mildew"

Moscow, Seleksiya i Seminovodstvo, Vol 36, No 6, Nov/Dec 71, pp 33-34

**Abstract:** Winter wheat in the Ukraine is damaged by powdery mildew to a considerable extent. The principal reason is planting of varieties that are not resistant to this disease. The Chair of Selection and Seed Growing, Ukrainian Academy of Agriculture, conducted field tests in which the resistance of 150 varieties of winter wheat to powdery mildew was determined. Methods recommended by the State Commission for the Testing of Varieties of Agricultural Crops were applied to evaluating the resistance of the varieties tested. The number of pustules on various parts of the plants, the yield, and the fullness of the grain were used as criteria in evaluating resistance. Twelve varieties were found to be highly resistant. Among them were varieties selected in the USSR, including Mironovskaya 808 and Rannyaya 12, local varieties from Latvia and L'vovskaya Oblast', and varieties introduced from foreign countries in which the disease occurs frequently (Korea, France, Italy, etc.). Varieties 1/2

USSR

ZELENSKIY, M. A., et al., Seleksiya i Seminovodstvo, Vol 36, No 6, Nov/Dec 71, pp 33-34

that were promising with respect to immunity to powdery mildew resulted from hybridization. Good results were obtained by repeated crossing of highly immune hybrids with cold-resistant varieties of the forest-steppe ecological type. It was established that in repeated crossing the best results with respect to development of resistant varieties were obtained by using a pollen recipient (maternal variety) that was more resistant to powdery mildew than the pollen donor (paternal variety).

"Uranium Hardened With Beryllium Oxide Particles"

Moscow, Atomnaya Energiya, Vol 29, No 3, Sep 70, pp 178-183

**Abstract:** The article describes results of a study of uranium hardened with beryllium oxide particles. Compositions were prepared by mixing uranium hydride and beryllium oxide powders. Several types of beryllium oxide powder were used, viz. ordinary commercial BeO and BeO obtained from beryllium acetate by the Funston method. The results indicate that the strengthening of uranium with dispersed beryllium oxide particles significantly increases its heat resistance. The creep rate declines with a drop in the annealing temperature of beryllium oxide during its preparation. The creep rate is highly sensitive to load. At 600° C the creep rate of precipitation-hardened uranium is the same as or below that of unalloyed uranium at 500° C and under the same stresses. The creep activation energies calculated

1/2

USSR

70, pp 178-183

from the slope of the curves  $\ln \dot{\epsilon} = f(\frac{1}{T})$  for the most heat-resistant compositions are considerably less than the self-diffusion activation energy and the creep activation energy of unalloyed commercial uranium. High-temperature softening in precipitation-hardened uranium is delayed 50-100°C as compared to unalloyed commercial uranium. Preliminary radiation test results indicate the high radiation resistance of precipitation-hardened uranium.

"Using the Nuclear Reaction  $O^{18}(p, \alpha)N^{15}$  to Study Oxidation of Metals"

Moscow, Atomnaya Energiya, Vol 30, No 5, May 71, pp 456-458

**Abstract:** In recent times data on nuclear reactions have been employed to study the processes taking place in the surface layers during oxidation of metals and alloys. Registering the reaction products of the material irradiated by charged particles makes it possible to determine the amount of the test element without ruining the sample and at the same time localizing it by depth. One of the methods suggested in this article involves registering and analyzing the energy spectrum of alpha-particles from the reaction  $O^{18}(p, \alpha)N^{15}$  by bombarding a sample containing the isotope  $O^{18}$  with a beam of monoenergetic protons.

The excitation function of the reaction  $O^{18}(p, \alpha)N^{15}$  was measured experimentally in the range of proton energies of 500-730 keV. Using the procedures discussed in the article, the authors find the distribution profile of oxygen in oxidized samples of zirconium. They also examine the possibility of making similar investigations using the narrow resonance of the reaction  $1/2$ .

USSR

SKAKUN, N. A., et al., Atomnaya Energiya, Vol 30, No 5, May 71, pp 456-458

$O^{18}$  ( $p, \alpha$ )  $N^{15}$  when  $E_p = 629$  keV. They also mention the possibility of using this resonance to study the thick surface layers of metals. All the investigations are supported by illustrations in the form of graphs.

The methods employed made it possible to investigate the interaction of oxygen with various solids, especially with the majority of metals and alloys used in the design of reactors.

This article contains 4 figures, 2 equations, and a bibliography of 5 titles.

"Oxidation of Magnesium and Metal Ceramic Mg-Be Alloys in Carbon  
Dioxide at 60 atm"

Moscow, Zashchita Metallov, Vol 7, No 2, Mar-Apr 71, pp 132-136

**Abstract:** The oxidation resistance of magnesium and its metal ceramic alloys with beryllium (0.5-5% Be) is studied in carbon dioxide gas with varying moisture content at 60 atm pressure and 470-580° temperature. In carbon dioxide gas containing over 0.5-1.0% H<sub>2</sub>O, the magnesium and Mg-Be alloys are damaged by intercrystalline and intracrystalline oxidation and an increase in size resulting from penetration of hydrogen into the structure of the metal or alloy. Sublayers of metals which absorb hydrogen intensively increase the oxidation resistance of magnesium and Mg-Be alloys in moist CO<sub>2</sub>. Type MG-1 magnesium is oxidation resistant up to 580° for over 1,000 hours in carbon dioxide gas with moisture content 0.001-0.01% at pressures of up to 60 atm. Increasing the moisture content over 0.2% causes intercrystalline

1/2

USSR

ZELENSKIY, V. F., et al., Zashchita Metallov, Vol 7, No 2,  
Mar-Apr 71, pp 132-136

and intracrystalline oxidation. Mg-Be alloys resist oxidation  
for crystalline and intracrystalline oxidation. Mg-Be alloys  
resist oxidation for over 10,000 hours in carbon dioxide con-  
taining 0.1-0.2% H<sub>2</sub>O under the same conditions. Moisture con-  
tents of 2% and more cause the formation of a rough, flaking  
scale on the alloys.

Chelyabinsk, V sh. "Osvoyeniye blokov moshchnost'yu 300 MVt na Ekibastuzsk. ugle" (Collection of Works-Assimilation of 300Mw Power Units Burning the Ekibastuz Region Coal), 1972, pp 105-115 (from Referativnyy Zhurnal-Teknologika, No 6, June 72, Abstract No 6C39)

**Abstract:** Scale appears to be the main source of abrasive particles which form on pipe inner surfaces made of perlitic steels, due to inadequacy of their actual temperature conditions to heat resistant characteristics of materials used. The admissible temperature of the superheater pipe wall outside surface appears to be 575°C for the 12Kh1MF steel and 585°C for the 12Kh2MFSR and EI531 steels. It is necessary to ensure an optimal fresh steam temperature control on units with direct flow boilers with the purpose of reducing not only the exit temperature but also the intermediates along the circuit. It is necessary to broaden the use of superheater packets made of scale proof steels in boilers, where the wall temperature

Ekibastuzsk.ugle", 1972, pp 105-115

is more than 575-585°C. Until elimination of scale formation, it is advisable to carry out periodically (once in 2-3 years) a chemical removal of scale from perlitic section of steam superheater. Loading of turbines of the Troitskoy Hydroelectric Power Station at the start from a cold and non-cooled state, as well as operation at partial loads should be conducted at slipping pressures with fully opened control valves. 5 figures, 5 references.

"Matrix Analysis of Complex Systems"

Novosibirsk, Matrichnyy analiz slozhnykh sistem (cf. English above), "Nauka", 1972, 146 pp, ill. 54 k. [from RZh-Kibernetika, No 5, May 73, abstract No SV351 K [annotation]]

Translation: The book discusses matrix analysis of systems described by a simple homogeneous Markov chain. The matrix method enables determination of the time, frequency and probability characteristics of a system in transient and steady-state conditions.

The method is used for analyzing the reliability of complex systems and studying the uniformity and reliability of measurement facilities being used.

"Electronic Melting of Metals"

Moscow, Elektronnaya plavka metallov (cf. English above), Revised edition,  
Metallurgiya, 1972, 348 pp (from Elektronnaya plavka metallov, pp 2-4)

Translation: The experience of Soviet and foreign researchers with respect to the development of the equipment and the technological process for melting metals by the method of electron bombardment is generalized in this book, and the work experience of the authors themselves is used. A study is made of the problems of the electron optical system, the electric power supply and the vacuum equipment of electron melting furnaces. Numerous data are presented on the studies of metals and alloys made by the method of electron bombardment and subjected to zonal purification. Some calculations are presented for the equipment to melt metals by electron bombardment, and variations in the chemical composition of metals and alloys during the melting process are illustrated. Some new prospects in the area of the application of the electron bombardment technique are investigated.

The book is intended for a broad class of engineering and technical workers of the research institutes, the design organizations and the nonferrous and ferrous metallurgical plants. It can be useful to students of the metallurgical and power engineering institutions of higher learning. There are 173 illustrations, 59 tables and a 199 entry bibliography.

"Hygienic Assessment of the Effects of Exposure to Heat"

Moscow, Gigiyena Truda i Professional'nye Zabolevaniya, No 3, 1973, pp 12-15

**Abstract:** Rabbits and rats exposed to infrared radiation at the rate of kcal/m<sup>2</sup>/hour for varying lengths of time exhibited changes in body weight, behavior, immunological reactivity (decrease in antibody titers and phagocytic activity of leukocytes), hormonal activity, tissue respiration in the liver and skeletal muscles, oxidative phosphorylation, etc. The magnitude of the changes varied with the duration and nature of the exposure (continuous or intermittent), intensity of radiation, relationship between time of irradiation and rest periods, etc. Infrared radiation also brought about changes in humans. The heart rate, blood pressure, body temperature, etc. were affected, the degree varying mainly with the intensity and duration of exposure, and the length of the interval between exposures.

EFFECT OF INTERMITTENT INFRARED RADIATION ON THE NATURAL  
IMMUNOLOGICAL REACTIVITY OF WORKERS

S. P. Zelenitskaya

Summary

The paper deals with the study of some indices characterizing natural immunological reactivity of the workers' organism, and also with the disease incidence of so-called "bad cold forms" occurring consequent to different modalities of infrared irradiation with equivalent summary dosage of the received heat. A long-term exposure of workers to the effects of infrared radiation with intensity of 1 to 3 cal/cm<sup>2</sup>/min in combination with high intermittence exercise adverse effect on the state of immunological reactivity, increasing the incidence rate of "bad cold forms" among workers. Intermittent infrared irradiation of low intensity (0.5—0.7 cal/cm<sup>2</sup>/min) acts stimulatingly and increases protective forces of the organism against unfavourable environmental factors.

"Effect of Infrared Radiation on the State of the Organism During Physical Work"

Kiev, Vrachebnoye Delo, No 12, Dec 72, pp 109-112

Abstract: The effects on the state of the organism of IR irradiation during physical work involving muscular effort were studied. Continuous irradiation with 300 kcal/m<sup>2</sup> hr at an intensity of 0.5 cal/cm<sup>2</sup> min during an hour or intermittent irradiation with the same amount of radiation per hour, but at intensities of 1.0 and 3.0 cal/cm<sup>2</sup> min for 30 and 10 min during the hour, respectively, was applied. The skin and body temperature of the subjects was increased. Under the effect of intermittent irradiation, the frequency of cardiac contractions increased in direct relation to the frequency with which periods of irradiation alternated with periods between them. Muscular strength, coordination, and the tolerance to the maximum static strain decreased under the effect of irradiation, with the indexes of muscular effort being affected to a greater extent at increasing frequencies of irradiation. The tolerance to the maximum static strain deteriorated to the greatest extent.

"The Effect of Intermittent Infrared Radiation on the Natural Immunological Reactivity in Workers"

Moscow, Gigiiena Truda i Professional'nyye Zabolevaniya, No 1, 1970,  
pp 22-26

**Abstract:** Immunological reactivity was studied in 100 workers in a glass plant by exposing them to infrared radiation of different durations and intensities. The reaction to the radiation was evaluated from the phagocytic activity of WBC, bactericidal properties of the saliva, and bactericidal properties of the skin. Intermittent irradiation at high intensities ( $1-3 \text{ cal/cm}^2/\text{min}$ ) was found to have an unfavorable effect on phagocytosis and the barrier function of the skin (the results of the saliva tests were unclear). On the other hand, chronic infrared irradiation at a low intensity ( $0.5-0.7 \text{ cal/cm}^2/\text{min}$ ) stimulated immunological reactivity in workers and increased their resistance to injurious environmental factors.

PROBLEMS OF INDUSTRIAL HYGIENE IN THE PRODUCTION OF HIGH-GRADE  
COMMERCIAL GLASS

Suponitskiy, M. Ya.; Shelyfman, F. M.; Zelenisova, S. P.;  
Faktorov, I. Ye.; Tupchiy, Ye. P.; Voloshina, E.I.; Levin, M. V.

Summary

Pollution of atmospheric environment with arsenous acid anhydride, lead, manganese oxide and other substances is possible in production of high-grade commercial glass. Workers engaged in the latter are, at the same time, exposed to the effect of infrared radiation, elevated air temperature, noise, vibration. They demonstrate physiological shifts of thermoregulation and the incidence of afflictions implicating cardiovascular system, digestive organs, etc is elevated among them. The authors suggested a number of measures aimed at improving hygienic conditions of work, some of which had been implemented.

Atomic Power Plants

## ATOMIC ELECTRIC POWER FOR HEAT SUPPLY

Article by S. A. Zhdov, doctor of technical sciences, A. Ye. Sviridov, candidate of engineering sciences, and O. P. Zelenyak, and V. P. Solntsev, engineers; "Application of Atomic Electric Power Stations for Centralized Heat Supply to Cities and Industrial Complexes", Kiev, Institute of Electrification, Russia, No. 3, May-June 1972, pp. 22-29]

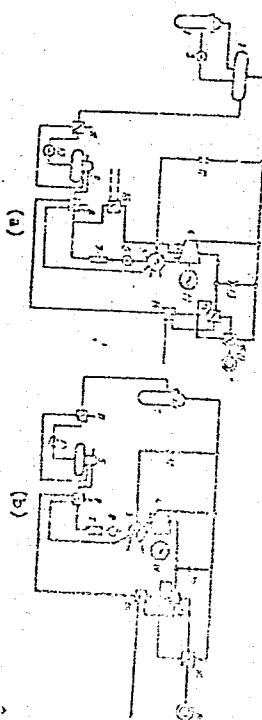

CDC 621.511.15-521.039

J725 5-1972  
AS 1972

Atomic power plants providing for heat supply to industrial complexes and cities and generation of electric power on a condensation system (heat-powered thermal-electric-power stations) fit an atomic unit or some capacity into the applied and the load factor of the reactors may be increased load during the year.

Diagrams of atomic units of such power plants are given in the figure. (a) represents an industrial heating plant; (b) and (c) are combustion turbines. In the atomic blocks of (a) and (b), respectively, one takeoff or with a production steam takeoff allows,

In block (c) with one reactor, two turbines are installed: one back-pressure turbine for distribution of industrial steam, and a second expansion turbine for the generation of electric power.

"Deformation and Rupture of Molybdenum Under Creep Conditions"

Kiev, Problemy Prochnosti, No 12, Dec. 1972, pp 85-89.

**Abstract:** Results are presented from creep and long-term strength tests in a vacuum at temperatures of 1,000-1,800°C, using specimens of technically pure molybdenum with concentrators in the form of apertures, as well as the results of studies of the concentration of deformations in a dangerous cross section near a notch. It is established that the influence of the concentrator on the strength of the material may be qualitatively and quantitatively different, depending on the test conditions; the stress concentration and deformation concentration factors in the elastic area coincide, the latter being independent of the plastic deformation over rather broad limits of deformation.

"Antimicrobial Activity of Extracts Obtained from Plants with Liquid Carbon Dioxide"

Kiev, Mikrobiologichny Zhurnal, No 2, Mar/Apr 70, pp 268-270

Abstract: Purified and crushed plant particles were extracted with carbon dioxide at a pressure of 60-65 atm at 20-23°C for 15-60 min. The micellae were filtered off, the gas evaporated at 30-35°C, and the anhydrous extract was collected, yielding liquid or oily residue with odors specific for various plants. Twenty spices and medicinal plants were studied and all showed some antibacterial and antifungal properties in a dilution of 1:2,500 to 1:10,000. Only the extract from hop cones exhibited activity against gram-positive bacteria at a dilution of 1:100,000 to 1:250,000, probably because of its content of soft resins and  $\alpha$ -acids. In sub-bacteriostatic doses, these agents failed to potentiate the activity of penicillin, streptomycin, levomycin, erythromycin, biomycin or framycin against *Staphylococcus aureus* No 209.

"Interaction of Impurities and Defects in GaAs Doped with Tellurium  
Ions"

Leningrad, Fizika i tekhnika poluprovodnikov, No 7, 1972, pp  
1385-1387

Abstract: This brief communication is the follow-up to an earlier paper (V. M. Zelevinskaya, et al, FTP, 5, 1971, p 1969) in which it was found that the behavior of impurities of atoms in the VI group used for doping GaAs is radically different from the behavior of doping atoms of the II and IV group. In that earlier paper, it was assumed that heavy selenium and tellurium ions amorphize the doped layer and that sulphur ions could not be used for doping. The purpose of the present paper is to check the validity of this assumption with an experiment involving the irradiation of the GaAs by Te ions with an energy of 40 kev and a dose of  $10^{15}/\text{cm}^2$  at various target temperatures. The method of irradiation as well as of the annealing and measurement procedures that followed it is given in another earlier article in the same journal (V. M.

Curves are plotted for the layer concentration and mobility of electrons as functions of the irradiation temperature, and for the change in layer resistance after irradiation as a function of isochronous annealing temperatures. It is concluded that the assumption noted above is correct. The authors express their gratitude to S. I. Romanov for the electronographic work.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. EXPERIMENTAL STUDY IN WHICH CONDUCTING FILMS WERE SYNTHESIZED ON SEMIINSULATING GALLIUM ARSENIDE BY BOMBARDMENT WITH XENON, KRYPTON, SELENIUM, AND ZINC IONS. THE CARRIER CONCENTRATION IN THE FILM IS 5 TIMES 10 TO THE 16TH PER CU CM, THE MOBILITY IS 10 SO CM-V SEC, AND THE THERMAL ACTIVATION ENERGY IS 0.07 EV. THE EFFECT OF THE DOSE RATE, THE ION ENERGY, AND THE SUBSTRATE TEMPERATURE ON THE FORMATION OF THE CONDUCTING FILM IS INVESTIGATED. WITH THE AID OF AN ETCHANT ACTING AT A RATE OF 5 TO 8 A-SEC, THE DISTRIBUTION OF THE FILM CONDUCTIVITY WITH DEPTH IS RECORDED. ON THE BASIS OF EXPERIMENTS ON ION BOMBARDMENT AND IRRADIATION OF SEMIINSULATING GAAS WITH REACTOR NEUTRONS AND ELECTRONS WITH AN ENERGY OF 3.5 MEV, IT IS CONCLUDED THAT AN INCREASE IN CONDUCTIVITY IS ATTRIBUTABLE MAINLY TO A MERGING OF THE BIAS PEAKS INTO A SINGLE FILM WHERE THE COMPENSATION CONDITIONS ARE NOT FULFILLED.

"Nuclear Rotational Excitations in the Method of the Generalized Density  
Matrix".

Moscow, Yadernaya Fizika; March, 1973; pp 525-39

**ABSTRACT:** A method, proposed earlier by the authors, in which a single-particle density matrix is considered as an operator in the space of collective excited states was applied to the study of nuclear rotation. A microscopic transformation similar to a transition to a system of natural axes of the generalized model was found. The operator structure of the equations was studied and a regular scheme for their solution worked out. An approximation -- which in the lower order gives the results of a model of forced rotation and in subsequent orders, nonadiabatic rotation effects -- was considered in detail.

The article includes 95 equations and a table showing the relations between the operators and matrix elements. There are 13 bibliographic references.

"Moment of Inertia in the Microscopic Theory of Nuclear Rotation"

Moscow, Izvestiya Akademii Nauk SSSR--Seriya Fizicheskaya, No 12, 1972, pp 2577-2584

**Abstract:** The authors use the method of an earlier paper (S. T. Belyayev, et al, Yadernaya fizika, 11, 1960, p 741) to consider quantum corrections for the cranking model, the basic method for examination of microscopic rotational excitation, thus clarifying deviations from the theory and improving agreement with experimental results. The authors find it convenient to introduce the generalized space of the states specified by the collective band characteristics--the moment of inertia, its projection on the laboratory axis and on the inner axis, and the single frequency quantum numbers. The rotational parameters are found by using the condition of moment matching, and it is noted that expressions deduced for the derivatives of the moment of inertia agree with those of earlier theoretical works. A table of the quantum corrections

is compiled. It is concluded that the theory advanced in this paper offers a complete quantitative description for the energy behavior of the lower portion in the basic band of even-even nuclei. The authors express their gratitude to S. T. Belyayev and V. B. Telitsin for their comments.

ABSTRACT. AN ANALOG OF THE GINZBURG LANDAU EQUATION IS DERIVED FOR A SUPERCONDUCTOR IN WHICH COOPER PAIRING TAKES PLACE IN STATES WITH NONZERO PAIR ANGULAR MOMENTUM L. THE EQUATION IS SIMILAR TO THE RADIAL SHROEDINGER EQUATION FOR AN L-TH PARTIAL WAVE WITH CUBIC NONLINEARITY. ITS SOLUTION IS A SPHERICAL VORTEX WHICH IS A PAIRS AS A WHOLE REVOLVE ABOUT THE VORTEX CENTER IN WHICH THE ORDER PARAMETER VANISHES. IT IS SHOWN THAT THE VORTEX STATE HAS A FREE ENERGY MINIMUM AS COMPARED WITH PREVIOUSLY PROPOSED SOLUTIONS.

MORE EFFICIENT USE OF AVAILABLE BEDS IN PROLONGED HOSPITALIZATION OF PATIENTS

[Article by S.A. Zarina, Department of Social Hygiene, Organization and History of Public Health (Chairman of the Scientific Council), Kiev Scientific Research Institute of General and Municipal Hygiene, Kiev, A.N. Marzayev, Moscow; Savatovskoye Zdravookhranenie, Russian Academy of Medical Sciences, 5, (1971), submitted 10 December 1970, pp 13-17]

The purpose of the present work was to investigate the composition of patients hospitalized for more than 15 days, as well as the causes of prolonged hospitalization for the purpose of finding reserves for more efficient use of available beds. According to data from domestic literature, the incidence of cases of prolonged hospitalization ranges from 14.6 to 27.7 percent of the total number of individuals hospitalized (Ye.I. Turmovskaya, 1966; S.Ya. Frejdina and A.I. Kagan, 1969).

We investigated 7,494 cases of hospitalization for periods of over 15 days in the therapeutic and surgical departments of Kiev hospitals in 1967.

Most of the patients (82.5%) treated for long periods in therapeutic departments were hospitalized for asthma, rheumatism, myocarditis, infarction, cholecystitis and cholelithiasis, and pneumonia. In the surgical departments, 70.6 percent of all cases of prolonged hospitalization were referable to Peptic ulcers, cholecystitis, cholangitis, and cholangitis, and 19.4 percent to vascular thrombosis of the lower extremities, endarteritis, embolism, and vascular accidents.

Women made up 58.3 percent of the patients hospitalized in therapeutic departments (for more than 30 days, and 51.7 percent of those in the surgical departments). Senior citizens made up over half of all those treated for more than 30 days (53.7% in therapeutic departments, and 50.7% in surgical departments).

The greatest number of prolonged hospitalization cases (as well as the concentration in them of the most seriously ill, which is attributable to the need of sub-complex diagnostic tests and, in part, to the interests of the pedagogic process).

"Factors Affecting the Expenditure of Metal in Sheet Rolling"

Moscow, Stal', No 2, Feb 71, pp 139-142

**Abstract:** This article reports on mathematical and statistical analyses made at the Orsko-Khalilov Metallurgical Combine of the factors determining variations in sheet steel lengths. Personnel of the plant have also computed the probability of obtaining ordered sheet lengths so that they can make an optimal choice of slab weights for their type-2800 thick-sheet mill. The finished sheets of 17G1S steel are 12.5 mm thick, 1.88 meters wide, and 12.1 meters long. To suit the welding procedures at the Chelyabinsk Tube-Rolling Plant to which they are sent to be welded into tubes of 1220-mm diameter for carrying gas, however, the lengths of these sheets may be 11.9, 11.5 or 11.3 meters. The article offers formulas and statistical data for computing the proper sheet lengths and other production parameters.

"Shock Resistance of 17G1S Sheet Steel at Low Temperatures"

Moscow, Stal', No 2, Feb 71, pp 171-173

**Abstract:** This article is a continuation of an earlier article written by the same authors and published in the journal named above (№ 6, 1966, pp 543-545) in which they examined the effect of the chemical composition of 17G1S steel, designed for manufacturing gas piping of large diameter, on its strength under shock at temperatures of from -40 to -60°C. Curves plotted for the frequency distribution of the metal's shock resistance show them to follow the normal law. The steel alloyed in a 400-ton furnace had a slightly lesser shock resistance than the steel manufactured in a furnace of lower capacity due, probably, to the 0.002-0.003% higher content of sulfur. The effect of this factor was investigated. Also investigated was the effect of manganese on the shock resistance of the steel; it was found that at -40°C the effect was negative, whereas at -60° it was positive.
